

ABSTRACT.

A patient interface for delivering pressurised gases to a user comprising a housing configured to receive gases and deliver them to a user and a forehead rest. The forehead rest is engaged with the housing and has a single area of contact with a user's forehead. The forehead rest includes a bridge portion between the user's forehead and housing allowing a substantially unrestricted view for a user's eyes. The forehead rest is pivotally movable in relation to the housing and can be locked by a friction engagement into position.
